# Year 6 Parent Numeracy Checklist

In Year 6, children work towards the following key skills. How confident is your child with the skills on this checklist? If you'd like help to help your child with these skills, you've come to the right place!

Your child will be learning the skills on this checklist throughout the year. There is no specific order to learning them and you can revisit them at any time.

## Whole Numbers

- 1 Find negative numbers on a number line
- 2 Identify and describe prime numbers and composite numbers
- 3 Create and describe square numbers and triangular numbers

## Addition and Subtraction

- 4 Solve addition and subtraction word problems

## Multiplication and Division

- 5 Solve multiplication and division word problems
- 6 Identify and use grouping symbols
- 7 Apply the order of operations

## Fractions and Decimals

- 8 Show, compare and order fractions with denominators 2, 3, 4, 5, 6, 8, 10, 12 and 100
- 9 Find, create and write equivalent fractions
- 10 Write fractions in their simplest form
- 11 Add and subtract fractions, including mixed numerals, with the same denominators
- 12 Find a simple fraction of a group
- 13 Add and subtract decimals up to 3 decimal places
- 14 Multiply and divide decimals by 1-digit and 2-digit whole numbers
- 15 Multiply and divide decimals by 10, 100 and 1000
- 16 Solve word problems involving fractions, decimals and money problems
- 17 Convert between equivalent percentages, fractions and decimals
- 18 Calculate 10%, 25% and 50% of amounts, including as discounts

## Patterns and Algebra

- 19 Find and apply the rule for geometric patterns and number patterns
- 20 Locate and record the coordinates of points in all 4 quadrants of the Cartesian plane

## Introduction to parent support kit in numeracy

Maths is everywhere! This kit can help you and your child to make real-life connections to what they're learning in the classroom. When children see, hear and use maths in real life, it gives their learning purpose. Use maths whenever you see the chance! Play maths games in the car. Involve the kids when you're cooking, shopping or budgeting. Add up the footy and cricket scores together. Talk about fractions as you serve food.

This parent support kit in numeracy is designed to help parents understand what children learn in each grade. At school, teaching is adjusted for the needs of each student. Children who show they have the skills listed in this kit will be working at grade level and assessed as sound.

This parent support kit uses parent-friendly language to explain the skills that children work to achieve by the end of each grade. We hope it empowers parents to help their children, and to participate in their child's education.

We know that every family is busy! The activities here are simple and straightforward. Any numeracy work you do at home with your child will help them in their learning. Your child's education is a partnership. Let's work together ...

### How to use this kit

This parent support kit:

- lists and explains the skills of children working towards a sound level
- shows ways to develop that skill with your child, including links to online resources like videos and games

Watch the videos to gain a deeper understanding of the skill. Work through the activities with your child. The suggestions here are a drop in the ocean – the internet has thousands! Use these as a starting point, and change them as you like.

**Definitions** are indicated by this icon throughout the kit. Lots of the definitions we use come from [www.schoolatoz.nsw.edu.au](http://www.schoolatoz.nsw.edu.au).

**Why is it important?** Next to this icon, you'll see 2 types of explanations:

- 1 Why this particular skill is important in the real world or for what children will be learning later on
- 2 Tips to help with learning

**A closer look:** This icon points the way to:

- an activity to help develop the skill or concept using familiar language for your child
- examples of problems
- handy tricks to help remember skills

**WEB link** This icon points the way to online resources you can use at home, like games, videos and further explanations.

*Notes: [Helping young kids get maths](#)*

*Video: [Helping your child with primary school maths](#)*

Use the kit whenever and however you can! Your child will be working towards these skills all year. You might like to review the kit each term, or more regularly. If you have any questions about your child's learning, always talk to their teacher. Remember – we're all in this together!

### Where do I learn more?

The key skills listed in the Grade Expectations kit are taken from the NSW Standards and Education Authority's (NESA's) [Mathematics K-6 continuum of key ideas](#). You can find the complete [mathematics syllabus](#) for every grade at the [NESA website](#).

## Whole Numbers: Key Skill 1

### Find negative numbers on a number line

**Negative numbers** mean numbers that are less than 0. They are on the left of 0 when we look at a number line.

A **number line** is a line of any length that can be used to show the position of numbers in relation to each other. The line can start and end on any number. Number lines use measurements to locate the place of numbers.

Negative numbers are used in real life to show something is less than 0. Number lines are helpful for explaining negative numbers. Use real life examples involving temperature and money to help your child understand negative numbers.

Map the temperatures over winter of a cold place like Antarctica, Russia or Canada. Graph your results.

Some liquids freeze at a temperature lower than 0 degrees celcius. Explore what liquids freeze at a lower temperature and see if you can find their freezing point.

Use a number line to jump over the 0 as you solve the questions. See who can make the trickiest question with the most jumps over 0.

$$5 + 2 - 8 - 2 + 4 = 1$$

$$4 - 10 + 5 - 6 + 9 = 2$$

$$-7 + 4 + 8 - 7 = -2$$

Here are some examples of negative number questions:

If an undersea valley is 64m below sea level and the nearby mountain is 26m above sea level, what is the distance between the depth of the valley and the top of the mountain?

*Answer:* 90m

I want to buy a phone but I don't have the money. The phone costs \$128 but I have to pay my parents \$50 that I owe them first. How much money do I need to save?

*Answer:* \$178

I have \$16 in the bank. I spend \$21. How much money do I now have?

*Answer:* - \$5

**WEB LINKS go to:**

[Notes: Negative numbers on the number line](#)

[Notes: Empty number lines](#)

[Video: Negative numbers](#)

[Video: Explanation of negative numbers](#)

[Game: Negative numbers](#)

## Whole Numbers: Key Skill 2

### Identify and describe prime numbers and composite numbers

---

A **prime number** has 2 factors (1 and the number itself).

A **composite number** has more than 2 factors.

A **factor** is a whole number that can be divided exactly into another whole number. For example, the factors of 12 are 12, 6, 4, 3, 2 and 1.

---

Knowing prime and composite numbers helps children to divide larger numbers and work with fractions. It helps when simplifying fractions. 1 is neither prime nor composite. It has only 1 factor: itself.

---

Create factor trees for numbers to find if they are prime or composite.

Use playing cards to make a game. Flip a card, and ask your child whether it is a prime or composite number, and why. Flip 2 cards to create bigger numbers. See who can get the most right in a row.

We can explain whether a whole number is prime, composite or neither by finding its factors:

13 has 2 factors (1 and 13). Therefore, 13 is a prime number.

21 has more than 2 factors (1, 3, 7, 21). Therefore, 21 is a composite number.

---

**WEB LINKS go to:**

[Video: Factor tree demonstration](#)

[Video: Prime and composite numbers](#)

[Video: What are factors?](#)

[Game: Prime numbers](#)

[Game: Number factors](#)

[Game: Factor trees](#)

## Whole Numbers: Key Skill 3

### Create and describe square numbers and triangular numbers

**Square numbers** are the result of multiplying a number by itself. The first 10 square numbers are 1, 4, 9, 16, 25, 36, 49, 64, 81, 100.

**Triangular numbers** can be represented by a triangular pattern of dots. The first triangular number is 1, followed by 3, 6, 10, 15, 21... Notice that the difference between 2 numbers increases by 1 each time.

$$1 \rightarrow 3 = 2 \quad 3 \rightarrow 6 = 3 \quad 6 \rightarrow 10 = 4$$

Working with square and triangular number patterns helps to find patterns.

Build arrays that show that triangular numbers are made by forming triangles that are even on all 3 sides. Work together to add the amounts of items used to build a bigger triangle. Can you find the pattern? This can also be done with square numbers, only with a square shape!

Use a multiplication grid to find all the square numbers and colour them in. Can you see a pattern? ([Here's a multiplication grid you can print](#)).

2 consecutive triangular numbers can be added to create a square number. Test this theory and see if it works.

Work together to find;

The next triangular number after 10?

*Answer: 15*

The square number before 64?

*Answer: 49*

**WEB LINKS go to:**

[Notes: Triangular numbers](#)

[Video: Explanation of square and triangular numbers](#)

[Game: Magic triangle](#)

## Addition and Subtraction: Key Skill 4

### Solve addition and subtraction word problems

For **word problems**, children need to read a story about a problem (often a real-life problem!) and then figure out what operations are needed to reach the answer.

Word problems are important because children must be able to choose and apply a strategy, estimate, solve it and check their answer. Most children will have difficulties in understanding what they need to do. Ask them to read the question carefully and decide what the most important information is and what operation they need to solve the question.

Try using the **CUBES** strategy for problem solving:

- C** Circle the numbers
- U** Underline the question
- B** Box the keywords
- E** Eliminate information not needed
- S** Solve by showing your working out

Newman's Analysis is another strategy to help with word problems.

- 1 **Read** the question to me.
- 2 Tell me **what** the question is asking you **to do**.
- 3 Tell me **how** you are going to find the answer.
- 4 **Show** me what to do to get the answer.
- 5 Now, **write** down your answer.

At the shops, give your children problems to work out like; I have \$10. I need to buy milk, bread and some apples. Help me work out how many apples I'll be able to buy after I buy the milk and bread.

Isla scored 134 in her first test, 56 in her second and 389 in her third. What was her total score for the 3 tests?

$$134 + 56 + 389 = 579$$

Isla scored 579 in total for 3 tests.

**WEB LINKS go to:**

[Video: How to solve word problems using newman's error analysis](#)

[Video: Explanation of newman's prompts](#)

## Multiplication and Division: Key Skill 5

### Solve multiplication and division word problems

For **word problems**, children need to read a story about a problem (often a real-life problem!) and then figure out what operations are needed to reach the answer.

Word problems are important because children must be able to choose and apply a strategy, estimate, solve it and check their answer. Most children will have difficulties in understanding what they need to do. Ask them to read the question carefully and decide what the most important information is and what operation they need to solve the question.

Newman's Analysis is a strategy to help with word problems.

- 1 **Read** the question to me.
- 2 Tell me **what** the question is asking you **to do**.
- 3 Tell me **how** you are going to find the answer.
- 4 **Show** me what to do to get the answer.
- 5 Now, **write** down your answer.

Here's an example question and some different strategies to solve it.

I earned \$126 per day for 7 days of work. How much money did I earn in total?

**Area model.** This involves drawing the multiplication problem as rectangular areas ([see Notes: Area model of multiplication](#)).

**Split strategy.** This involves splitting the question into its place values

$$\begin{aligned} 7 \times 126 &= (7 \times 100) + (7 \times 20) + (7 \times 6) \\ &= 700 + 140 + 42 \\ &= 882 \end{aligned}$$

**Extended multiplication**

$$\begin{array}{r} 126 \\ \times \quad 7 \\ \hline 42 \\ 140 \\ + 700 \\ \hline 882 \end{array}$$

**Contracted multiplication**

$$\begin{array}{r} 126 \\ \times \quad 7 \\ \hline 882 \end{array}$$

**Short division** (different question)

$$\begin{array}{r} 126 \div 7 = \\ \underline{18} \\ 7 \overline{) 126} \end{array}$$

**WEB LINKS go to:**

[Video: Short division with a decimal remainder](#)

## Multiplication and Division: Key Skill 6

### Identify and use grouping symbols

**Grouping symbols**, i.e. ( ), [ ], are used to separate operations (+, −, ×, ÷) in an equation. Always do the operation inside the grouping symbols first, then any operations outside the grouping symbols. Parentheses and brackets mean the same thing.

An **equation** is a number sentence. It uses numbers and symbols to describe a maths problem.

When an equation contains more than 1 operation, grouping symbols help us to know which order to work in. This skill is important to help with the order of operations and high school algebra.

When there is more than 1 grouping symbol, start with the one in the middle

e.g.  $3 + [20 \div (9 - 5)] = 3 + [20 \div 4] \rightarrow 9 - 5$  was done first

$$= 3 + 5$$

$$= 8$$

Practice this skill often but for a short amount of time for maximum impact.

Explore maths questions with 2 operations and play around with moving the brackets. How do the brackets change the answer?

$$(5 + 6) \times 3 = 11 \times 3$$

$$= 33$$

$$5 + (6 \times 3) = 5 + 18$$

$$= 23$$

**WEB LINKS go to:**

[Video: Grouping symbols](#)

[Video: Parentheses worked examples](#)

## Multiplication and Division: Key Skill 7

### Apply the order of operations

The **order of operations** is a step by step method to solve complex calculations.

**Exponents** – A small number placed to the upper right of number which shows how many copies of the number are multiplied together. Indices and ordinals mean the same thing.

e.g.  $5^2 = 5 \times 5 = 25$        $6^4 = 6 \times 6 \times 6 \times 6 = 1\,296$

The order of operations is a mathematical law that makes sure equations are solved correctly. We use acronyms to help us remember the order of operations. They all mean the same thing; they're just different ways of explaining it.

**BODMAS** – Brackets, Ordinals, Division, Multiplication, Addition, Subtraction

**PEDMAS** – Parentheses, Exponents, Division, Multiplication, Addition, Subtraction

**PIDMAS** – Parentheses, Indices, Division, Multiplication, Addition, Subtraction

**BIDMAS** – Brackets, Indices, Division, Multiplication, Addition, Subtraction

Remember to work from left to right if there is a division and multiplication grouped together, and addition and subtraction grouped together.

Children will often be unaware that they have used the order of operations in the wrong order and have the wrong answer. Practice this skill often but for a short amount of time for maximum impact.

Using word problems can help children to apply the order of operations. For example: I buy 6 goldfish costing \$10 each and 2 water plants costing \$4 each. What is the total cost? This can be written as the number sentence  $6 \times 10 + 2 \times 4$ .

Right (multiply 1st) –  $6 \times 10 + 2 \times 4 = 60 + 8 = 68$       Wrong (add 1st) –  $6 \times 10 + 2 \times 4 = 6 \times 12 \times 4 = 288$

Give your child lots of opportunities to apply the order of operations. Write out equations with multiple operations, grouping symbols and exponents. This skill needs lots of practice!

$2 \times 5 - (3+7) =$

$6^2 + 3 \times 6 =$

$14 - 2 \times 3 \div 2 =$

**WEB LINKS go to:**

[Video: BODMAS song](#)

## Fractions and Decimals: Key Skill 8

### Show, compare and order fractions with denominators 2, 3, 4, 5, 6, 8, 10, 12 and 100

A **numerator** is the number above the line in a fraction which shows how many parts are being considered.

A **denominator** is the number below the line in a fraction. It shows the number of parts a whole has been divided into.

The line in between the numerator and the denominator is called the **fraction bar**. Division bar and vinculum mean the same thing.

Pictures are hugely helpful in understanding fractions. A common mistake is thinking the larger denominator creates a larger fraction. It is the opposite for fractions. The smaller the denominator, the larger the fraction.

From Year 5, children start working with fractions where the numerator changes the size of the fraction too. For example,  $\frac{7}{8}$  is larger than  $\frac{1}{2}$

Plotting fractions on a number line helps children to see fractions as a (smaller) number in their own right. This is important for learning to multiply and divide fractions in later years.

Write a group of fractions out and work together to plot them on a number line. This can be trickier than it seems!

Ask your child to write down 15 fractions between 3 and 4. Look for your child using only  $\frac{1}{2}$  and  $\frac{1}{4}$

Use drawings or a number line to show how this is possible and what answers there could be. There are lots of different answers you can make!

Play a game of Less than, more than. Use Uno cards to draw 4 cards and then work together to make number sentences true. There are lots of different questions that can be asked and solutions created. You can choose to move the greater than or less than symbols or challenge yourselves to keep them as they are!

Here is an example:

$$\begin{array}{ccc} \triangle & \triangle & 3 \\ - & > - & < - \\ \triangle & 8 & \triangle \end{array}$$

**WEB LINKS go to:**

[Notes: Empty number lines](#)

[Game: The legend of dick and dom comparing fractions](#)

[Game: Fraction monkeys](#)

## Fractions and Decimals: Key Skill 9

### Find, create and write equivalent fractions

**Equivalent fractions** are fractions that are equal in value, but have different names e.g.  $\frac{4}{8} = \frac{1}{2}$

It's important to remember that fractions represent equal parts of a whole. To help children to find equivalence between fractions use number lines or pictures.

This key idea focuses on the denominators:

- 2, 4 and 8, e.g.  $\frac{1}{2} = \frac{2}{4} = \frac{4}{8}$
- 3 and 6, e.g.  $\frac{1}{3} = \frac{2}{6}$  or  $\frac{2}{3} = \frac{4}{6}$
- 5, 10 and 100, e.g.  $\frac{1}{5} = \frac{2}{10} = \frac{20}{100}$  or  $\frac{3}{5} = \frac{6}{10} = \frac{60}{100}$

Children find it easier to double to find equivalent fractions than to reduce.

To create equivalent fractions

**Larger** – multiply the numerator and denominator by the same number

$$\frac{1}{2} \times \frac{2}{2} = \frac{2}{4}$$

$$\frac{3}{4} \times \frac{3}{3} = \frac{9}{12}$$

**Smaller** – divide the numerator and denominator by the same number.

$$\frac{6}{12} \div \frac{3}{3} = \frac{2}{6}$$

$$\frac{25}{100} \div \frac{5}{5} = \frac{5}{20}$$

**WEB LINKS go to:**

[Video: Equivalent fractions on a number line](#)

[Game: Equivalent fractions easy](#)

[Game: Equivalent fractions](#)

[Game: Equivalent fractions baseball](#)

## Fractions and Decimals: Key Skill 10

### Write fractions in their simplest form

A fraction is in its **simplest form** when the denominator is the smallest it can possibly be (while still being a whole number). It is never an improper fraction but can be a mixed numeral.

**Highest common factor** (HCF) of 2 or more whole numbers is the largest number that will divide exactly into each of the numbers.

Reducing fractions to their simplest form makes fractions easier to work with especially when learning algebra in high school. Knowing your times tables helps children to find the highest common factors and simplify fractions easily.

Knowledge of factors and multiples, equivalent fractions and converting improper fractions to mixed numerals is essential for this skill. ([See video: HCF with factor tree](#))

When simplifying fractions:

- 1 Convert any improper fractions to mixed numerals.
- 2 What are the factors of the numerator?
- 3 Does the denominator share any of those factors? (If yes, then it can be reduced!)
- 4 Use the HCF and divide both the numerator and denominator by that number.

Here are some examples:

$$\frac{3}{9} \quad \text{Factors of 3 are 1, 3}$$

Factors of 9, 1, 3, 9 (3 is the HCF)

$$\frac{3}{9} \div \frac{3}{3} = \frac{1}{3}$$

$$\frac{3}{9} = \frac{1}{3}$$

$$\frac{5}{20} \quad \text{Factors of 5 are 1, 5}$$

Factors of 20 are 1, 20, 2, 10, 5, 4 (5 is the HCF)

$$\frac{5}{20} \div \frac{5}{5} = \frac{1}{4}$$

$$\frac{24}{18} = 1 \frac{6}{18}$$

Factors of 6 = 1, 6, 2, 3

Factors of 18 = 1, 18, 2, 9, 3, 6 (6 is the HCF)

$$\frac{6}{18} \div \frac{6}{6} = \frac{1}{3}$$

$$\frac{24}{18} = 1 \frac{1}{3}$$

**WEB LINKS go to:**

## Fractions and Decimals: Key Skill 11

### Add and subtract fractions, including mixed numerals, with the same denominators

A **mixed numeral** is a number made up of a whole number and a proper fraction.

A **denominator** is the number below the line in a fraction. It that shows the number of parts a whole has been divided into.

When adding and subtracting with the same denominator, the numerator is added or subtracted and the denominator stays the same. With mixed numerals, the whole numbers are added or subtracted together and the fractions are added and subtracted together, then the whole numbers and fractions are added together. Show answers in their simplest form.

**Level 1** Adding and subtracting

$$\frac{2}{6} + \frac{2}{6} = \frac{4}{6} \qquad \frac{3}{8} + \frac{4}{8} = \frac{7}{8} \qquad \frac{8}{9} - \frac{5}{9} = \frac{3}{9} \qquad \frac{5}{10} - \frac{3}{10} = \frac{2}{10}$$

**Level 2** Adding and subtracting with mixed numerals

$$\begin{aligned} 1\frac{2}{5} + 2\frac{1}{5} &= (1+2) + \left(\frac{2}{5} + \frac{1}{5}\right) & 7\frac{3}{6} - 4\frac{2}{6} &= (7-4) + \left(\frac{3}{6} - \frac{2}{6}\right) \\ &= 3 + \frac{3}{5} & &= 3 + \frac{1}{6} \\ &= 3\frac{3}{5} & &= 3\frac{1}{6} \end{aligned}$$

**Level 3** Adding and subtracting when conversions are needed

$$\begin{aligned} \frac{4}{5} + \frac{4}{5} &= \frac{8}{5} = 1\frac{3}{5} & \frac{4}{6} + \frac{5}{6} &= \frac{9}{6} = 1\frac{3}{6} \\ 1\frac{1}{5} - \frac{4}{5} &= \frac{6}{5} - \frac{4}{5} = \frac{2}{5} & 1\frac{2}{4} - \frac{3}{4} &= \frac{6}{4} - \frac{3}{4} = \frac{3}{4} \end{aligned}$$

**Level 4** Adding and subtracting with mixed numerals when conversions are needed

$$\begin{aligned} 1\frac{5}{7} + 3\frac{4}{7} &= (1+3) + \left(\frac{5}{7} + \frac{4}{7}\right) & 3\frac{1}{8} - 1\frac{5}{8} &= 2\frac{9}{8} - 1\frac{5}{8} \\ &= 4 + \frac{9}{7} & &= (2-1) + \left(\frac{9}{8} - \frac{5}{8}\right) \\ &= 4 + 1\frac{2}{7} & &= 1 + \frac{4}{8} \\ &= 5\frac{2}{7} & &= 1\frac{4}{8} \end{aligned}$$

**WEB LINKS go to:**

[Game: Adding and subtracting fractions](#)

[Game: Adding and subtracting fractions with different denominators](#)

## Fractions and Decimals: Key Skill 12

### Find a simple fraction of a group

**Fraction of a group** is the same as the fraction of a whole. We find a fraction of a group of objects. So to find  $\frac{1}{2}$  of 10 objects is 5 objects. Fractions of a quantity and fractions of a collection mean the same thing.

Multiplying fractions is the main way to find a fraction of a quantity. That is, if we need to find  $\frac{1}{5}$  of 50, we can calculate  $\frac{1}{5} \times 50 = 25$ . Fractions of a group or fractions of a collection mean the same thing.

Start by multiplying fractions where the numerator is 1. When the numerator changes to more than 1, questions become harder e.g.  $\frac{1}{3}$  of 12 first, then try  $\frac{2}{3}$  of 12.

Use the multiplication symbol (x) and the word 'of' to multiply fractions by whole numbers.  $\frac{2}{6}$  of 12 and  $\frac{2}{6} \times 12$  mean the same thing.

The simplest way of multiplying a fraction by a whole number is to use the inverse operation. When we look at the example of  $\frac{1}{2} \times 50$ , we think 'How many times does 2 fit into 50?' (That is, 50 divided by 2 equals 25). Therefore  $\frac{1}{2} \times 50 = 25$ .

Another way is to:

- divide the whole number by the denominator
- then times the answer by the numerator.

#### Level 1

$$\begin{aligned} \frac{1}{4} \times 20 &= 20 \div 4 \text{ (divide whole number by denominator)} \\ &= 5 \times 1 \text{ (times answer by numerator)} \\ &= 5 \end{aligned}$$

#### Level 2

$$\begin{aligned} \frac{3}{5} \text{ of } 30 &= 30 \div 5 \text{ (divide whole number by denominator)} \\ &= 6 \times 3 \text{ (times answer by numerator)} \\ &= 18 \end{aligned}$$

Ask your child to find fractions of different amounts in daily life, e.g. Our shopping cost \$125.

What is  $\frac{1}{4}$  of this?

**WEB LINKS go to:**

[Video: Multiplying fractions by whole numbers visual](#)

[Video: Multiplying fractions by whole numbers](#)

[Game: Multiplying fractions](#)

## Fractions and Decimals: Key Skill 13

### Add and subtract decimals up to 3 decimal places

**Decimal places** are the numbers after (to the right of) the decimal point.

When working with decimals, it is important children estimate before working out an answer. This will help them remember the decimal and put it in the right place.

When adding or subtracting decimals mentally, children can use the split, jump or compensation strategy (Year 3 Key Skills 5–7)

**Split** – when no trading is needed

$$\begin{aligned} 4.9 + 6.4 &= (4 + 6) + (0.9 + 0.4) \\ &= 10 + 1.3 \\ &= 11.3 \end{aligned}$$

**Jump** – when trading is needed

$$\begin{aligned} 6.4 - 3.5 &= 6.4 - 0.5 \\ &= 5.9 - 3 \\ &= 2.9 \end{aligned}$$

**Compensation** – when you can round 1 of the numbers easily.

$$\begin{aligned} 9.999 - 4.576 &= 10 - 4.576 (+0.001) \\ &= 5.424 (-0.001) \\ &= 5.423 \end{aligned}$$

When we add or subtract decimals using a written strategy, we do it the same way as with whole numbers with and without trading (Year 4 Key Skill 7). When adding and subtracting – the decimal point never moves! Remember to include decimals where 0s are needed. If you have 1 decimal that is longer than the other, you can make them the same by adding 0s to the end. This is especially important in subtraction.

**Without trading**

$$\begin{array}{r} 4.9 \\ \underline{6.4} + \\ 11.3 \end{array} \qquad \begin{array}{r} 8.65 - \\ \underline{5.43} \\ 3.22 \end{array}$$

**With trading**

$$\begin{array}{r} 6.795 \\ \underline{4.556} + \\ 11.351 \end{array}$$

**When to add 0s**

$$\begin{array}{r} 4.6 - \\ \underline{3.456} \\ 1.144 \end{array} \qquad \begin{array}{r} 4.600 \\ \underline{3.456} \\ 1.144 \end{array}$$

## Fractions and Decimals: Key Skill 15

### Multiply and divide decimals by 10, 100 and 1000

**Decimal places** are the numbers after (to the right of) the decimal point.

Children need to know how to multiply decimals by 10, 100 and 1000 because it helps them to estimate answers, find percentages and better understand decimal place value. This helps children to solve problems involving decimal numbers.

There is a rule for powers of 10 (10, 100, 1 000, 10 000 etc)

To **multiply**, we teach the children to move the decimal point to the **right** 1 place when we multiply by 10, 2 places when we multiply by 100 and 3 places when we multiply by 1000.

e.g.  $3.4 \times 10 = 34$        $3.4 \times 100 = 340$        $3.4 \times 1000 = 3400$

To **divide**, we teach the children to move the decimal point to the **left** 1 place when we divide by 10, 2 places when we divide by 100 and 3 places when we divide by 1000.

e.g.  $356.2 \div 10 = 35.62$        $356.2 \div 100 = 3.562$        $356.2 \div 1000 = 0.3562$

## Fractions and Decimals: Key Skill 16

### Solve word problems involving fractions, decimals and money problems

For **word problems**, children need to read a story about a problem (often a real-life problem!) and then figure out what operations are needed to reach the answer.

Word problems are important because children must be able to choose and apply a strategy, estimate, solve it and check their answer. Most children will have difficulties in understanding what they need to do. Ask them to read the question carefully and decide what the most important information is and what operation they need to solve the question.

Try using the **CUBES** strategy for problem solving:

- C** Circle the numbers
- U** Underline the question
- B** Box the keywords
- E** Eliminate information not needed
- S** Solve by showing your working out

Newman's Analysis is another strategy to help with word problems.

- 1 **Read** the question to me.
- 2 Tell me **what** the question is asking you **to do**.
- 3 Tell me **how** you are going to find the answer.
- 4 **Show** me what to do to get the answer.
- 5 Now, **write** down your answer.

Real-life money problems are always helpful. For example:

- Add the cost of each item in a shopping list to create a shopping budget.
- What is 10% off the cost of items at the supermarket?
- If you eat  $\frac{1}{6}$  of a pizza and a friend eats  $\frac{1}{5}$ , how much is left?

## Fractions and Decimals: Key Skill 17

### Convert between equivalent percentages, fractions and decimals

**Percentages, fractions and decimals** can all mean the same thing, they represent a part of a whole number. That is,  $\frac{1}{2} = 0.5 = 50\%$ . Also,  $\frac{1}{4} = 0.25 = 25\%$ .

It is important children can swap between decimals, percentages and fractions to solve questions. Children will find converting decimals to percentages and vice versa the easiest with converting to and from fractions the hardest.

#### Decimals to percentages

**Dr Pepper** – The name Dr Pepper shows which way to move the decimal point. Dr always moves 2 decimal places towards Pepper (in this case right). 0.43 as a % is 43%

#### Percentages to decimals

**Pepper Dr** – The name Pepper Dr shows which way to move the decimal point. Dr always moves 2 decimal places towards Pepper (in this case left). 58% as a decimal is 0.58

#### Fractions to decimals

**Cowboy Method** – This story helps to set your working out correctly. It is also easy to remember!

**Cowboy Story** – The cowboy rides the horse. The cowboy goes inside the house. Takes off his boots, hangs up his hat and eats 3 donuts. The horse stays outside the house.

The cowboy is the numerator, the horse is the denominator. The cowboy goes into his house (the long division symbol) and the horse stays outside (the left of the long division symbol.) His boots and hat are the 2 decimal points (1 inside the question next to your numerator and 1 on top in the same place) and the 3 donuts are 0s added to the right of the decimal point after the cowboy. Then solve the division question ([see Video: Cowboy method](#)).

$$\begin{array}{r} 0.600 \\ 3 \overline{) 3.000} \\ \underline{3} \phantom{00} \\ 0 \phantom{00} \\ \underline{0} \phantom{0} \\ 0 \phantom{0} \\ \underline{0} \phantom{0} \\ 0 \phantom{0} \end{array}$$

$$\frac{3}{5} = 0.6$$

#### Fractions to Percentages

**Free Dr Pepper** – To convert fractions to percentages, we convert fractions to decimals, and then decimals to percentages.

Here are some examples:

$$\frac{1}{4} = \frac{25}{100} = 0.25 = 25\% \qquad \frac{4}{5} = \frac{80}{100} = 0.80 = 80\%$$

#### Percentages to Fractions

**Reverse Free Doctor Pepper** and change percentage to a decimal, then the decimal to a fraction.

## Fractions and Decimals: Key Skill 18

### Calculate 10%, 25% and 50% of amounts, including as discounts

Calculating percentages is a skill that is used in everyday life. We use this skill to find statistics in sport, compare growth and in money.

Here are some examples:

Ena gets 32 out of 40 shots in during her netball match. Using a calculator, what is her shooting percentage?

$$32 \div 40 = 0.8 \times 100 = 80$$

*Answer:* Ena's shooting percentage is 80%

It's 25% off all DVDs at JB Hi-Fi. The DVD Emily wants is \$20. How much will she save?

To find 25% of a quantity, we divide it by 4, because  $25\% = \frac{1}{4}$   
 $25\% \text{ of } 20 = 20 \div 4 = 5.$

*Answer:* Emily will save \$5

Lisa's bank account has halved over this month. It started at \$20. How much is in her bank account now?

To find 50% of a quantity, we divide it by 2, because  $50\% = \frac{1}{2}$   
 $50\% \text{ of } 20 = 20 \div 2 = 10.$

*Answer:* There is \$10 left in Lisa's bank account.

Children also need to know how to calculate a discounted price. We do this by finding the dollar amount of the percentage discount, and subtracting it from the original price.

Here are some examples:

For example, to calculate 25% off \$40 we would find  $\frac{1}{4} \times \$40$  (25%) Then subtract the answer from \$40.  
 $\$40 \div 4 = \$10.$  So  $\$40 - \$10 = \$30.$

The new price is \$30.

George can get 10% off his \$20 t-shirt. How much will he pay for the t-shirt?

To find 10% of \$20, we divide 20 by 10.

$$10\% \text{ of } 20 = 20 \div 10 = 2.$$

$$\$20 - \$2 = \$18$$

*Answer:* George will pay \$18 for his t-shirt

## Patterns and Algebra: Key Skill 19

Find and apply the rule for geometric patterns and number patterns.

**Geometric patterns** are patterns created by shapes and **number patterns** by numbers.

A **rule** works out the value of any part of the pattern. Rules help to continue patterns. **Term** is one of the numbers in a sequence e.g. in 2, 4, 6, the 3 terms are 2, 4, and 6.

Finding and applying patterns are vital for children in algebra in Year 7.

The **function rule** finds the value of **any** term in a pattern. Look for an operation that finds the bottom number every time. Both the top and bottom numbers must follow this pattern for every term.

To find a pattern we:

- 1 **Work out what happens** to the top number to get the bottom number.
- 2 **Check it works** for the next term.
- 3 **If yes**, you have found your function rule! Apply it to find your missing number.
- 4 **If no**, try something else and start the process again. You may have used the wrong operation.

Here are some examples:

24	21	18	15	6
19	16	13	10	

- 1 To get from 24 to 19, you can  $-5$ .  $24 - 19 = 5$
- 2  $21 - 5 = 16$ .
- 3 It works! The function rule is  $-5$ .  $6 - 5 = 1$ . The missing number is 1

George earned \$2 for each hour he worked. How much did he earn in 10 hours?

Hours	1	2	3	4	10
\$ Earned	\$2	\$4	\$6	\$8	

- 1 To get from 1 to 2, you can  $+1$ .  $1 + 1 = 2$
- 2  $2 + 1 = 3$ , we needed 4 to be our answer.

Another way to get from 1 to 2 is  $1 \times 2 = 2$

- 1  $2 \times 2 = 4$ ,
- 2  $3 \times 2 = 6$  – The function rule is  $\times 2$ !
- 3  $10 \times 2 = 20$ . George earned \$20 in 10 hours.

## Patterns and Algebra: Key Skill 20

### Locate and record the coordinates of points in all 4 quadrants of the Cartesian plane

The **Cartesian plane** is 2 number lines that cross at 0; 1 line is horizontal and the other is vertical. It is used to plot points. Negative numbers are to the left of or below 0; positive numbers are to the right of or above 0. Cartesian plane, number plane and coordinate plane mean the same thing.

The Cartesian plane is an extension of a number line. The concept helps us to describe and visualise algebraic relationships and to better understand algebra. It is an important concept for all areas of high school maths. Children find finding and reading a point on a plane easier and plotting on a plane harder.

Children work from 1st quadrant (+, +), to 2nd quadrant (+, – and 3rd (–, +) and 4th (–, –) quadrants last (see [Video: Coordinate Plan](#)).

Play Battleships.

When we work with maps, we use coordinates. This is very similar to the Cartesian plane so any opportunity to read and use maps helps children to understand the Cartesian plane. Use a map when you go for a drive or a bushwalk. Work together to read the map as you make your journey.

Read maps in an atlas and use coordinates to find countries or places of interest. Have a race to see who can find a location in an atlas the fastest. Start with the book closed and use the index to find the coordinates of the place and page number.

Create a shape or a picture on the Cartesian plane and then work together to write the coordinates out so that someone can copy your shape or picture on another plane perfectly.
